

This homework is optional. Any problem that you do not submit will be automatically forgiven.

A useful list of NP-hard problems appears on the next page.

1. In the task scheduling problem, we are given n tasks, identified by the integers 1 through n , and a set of precedence constraints of the form “Task i must be executed before task j .” A *feasible schedule* is an ordering of the n tasks that satisfies all the given precedence constraints.
 - (a) Given a set of tasks and precedence constraints, describe and analyze a polynomial-time algorithm to determine whether a feasible schedule exists.
 - (b) Suppose we are given a set of precedence constraints for which there is no feasible schedule. In this case, we would like a schedule that violates the minimum number of precedence constraints. Prove that finding such a schedule is NP-hard.

2. Recall that a 5-coloring of a graph G is a function that assigns each vertex of G a ‘color’ from the set $\{0, 1, 2, 3, 4\}$, such that for any edge uv , vertices u and v are assigned different ‘colors’. A 5-coloring is *careful* if the colors assigned to adjacent vertices are not only distinct, but differ by more than 1 (mod 5). Prove that deciding whether a given graph has a careful 5-coloring is NP-hard. [Hint: Reduce from the standard 5COLOR problem.]

A careful 5-coloring.

3. (a) A *tonian path* in a graph G is a path that goes through at least half of the vertices of G . Show that determining whether a given graph has a tonian path is NP-hard.
- (b) A *tonian cycle* in a graph G is a cycle that goes through at least half of the vertices of G . Show that determining whether a given graph has a tonian cycle is NP-hard. [Hint: Use part (a).]

You may assume the following problems are NP-hard:

CIRCUITSAT: Given a boolean circuit, are there any input values that make the circuit output True?

PLANARCIRCUITSAT: Given a boolean circuit drawn in the plane so that no two wires cross, are there any input values that make the circuit output True?

3SAT: Given a boolean formula in conjunctive normal form, with exactly three literals per clause, does the formula have a satisfying assignment?

MAX2SAT: Given a boolean formula in conjunctive normal form, with exactly two literals per clause, what is the largest number of clauses that can be satisfied by an assignment?

MAXINDEPENDENTSET: Given an undirected graph G , what is the size of the largest subset of vertices in G that have no edges among them?

MAXCLIQUE: Given an undirected graph G , what is the size of the largest complete subgraph of G ?

MINVERTEXCOVER: Given an undirected graph G , what is the size of the smallest subset of vertices that touch every edge in G ?

MINSETCOVER: Given a collection of subsets S_1, S_2, \dots, S_m of a set S , what is the size of the smallest subcollection whose union is S ?

MINHITTINGSET: Given a collection of subsets S_1, S_2, \dots, S_m of a set S , what is the size of the smallest subset of S that intersects every subset S_i ?

3COLOR: Given an undirected graph G , can its vertices be colored with three colors, so that every edge touches vertices with two different colors?

MAXCUT: Given a graph G , what is the size (number of edges) of the largest bipartite subgraph of G ?

HAMILTONIANCYCLE: Given a graph G , is there a cycle in G that visits every vertex exactly once?

HAMILTONIANPATH: Given a graph G , is there a path in G that visits every vertex exactly once?

TRAVELINGSALESMAN: Given a graph G with weighted edges, what is the minimum total weight of any Hamiltonian path/cycle in G ?

SUBSETSUM: Given a set X of positive integers and an integer k , does X have a subset whose elements sum to k ?

PARTITION: Given a set X of positive integers, can X be partitioned into two subsets with the same sum?

3PARTITION: Given a set X of n positive integers, can X be partitioned into $n/3$ three-element subsets, all with the same sum?
